Can you have Windows XP on a FAT 32 partition, with a larger NTFS partition on the same drive, and be able to read, write and transfer files back and forth between the partitions? If you were running a audio program, could you have it write the files (audio path) to the NTFS partition, and play them back? I want to say yes to all of the above, but it's been a while.

Thanks

KJ

Yes you can but make the audio drive clusters as big as possible to allow large files to be easily written.
