Why can we only render Native effects? It would be great to render eds effects
- is there a way to do this?

Thanks!!!!!!

I doubt this will ever happen as the on-board DSP works only in real time...

David.

There is a way to render EDS effects but it's a harder way. Make the choice
of wich file you will render with just EDS, pan it to right or left and mute
all other files. Do a stereo mixdown and import the file back to the
project.

I've never tried this, but what if you go to the patchbay and route the insert out of the channel you want to render to the input of another channel, set up your EDS FX and then, in the last open EDS slot set it to "external".

Do you think you'd be able to record the EDS effected output of that track to the new track? Still would have to be real time, though...

I don't know Gantt. I knew stereo mixdown was the only way to render with earlier Paris versions, as far as I know, so I believed it was the same route in version 3 with EDS.

If you have an adat card in your system, you can do a render using aux sends to route to adat outputs. Loop the adat optical out to in, then route the adat inputs to free channels and record the results. It's the same as the SPDIF loop thing, but 8 channels at a time (or 16 if you have 2 adat cards, one in each of two MEC's). One caveat... the loop on adat will be 20bit resolution only.

David.

I know that you can route the stereo output from the master module to two channel inputs. I've run simultaneous ruff mixes that way. Why, then, couldn't you run an EDS effect output to a channel input? I'm, gonna have to give it a try just to see!

You can totally do this. but you would take an converter hit, unless you did it through the spdif. I'ts pretty much the Brian T method of rendering autotune. You could also use adat. Your limiting to 20 bits, but heck, a lot of "24" bit audio is really only 20 usable bits anyway.
