[View Forum Message](#) <> [Reply to Message](#)

A couple of days ago I did some tracks for a client and burnt a CD-Rom containing wave files for him to take to another studio to do some other work. It was labled "Data CD".

I explained how all the files were perfectly synced so the protocols guy could drag them in to his session.

Five minutes after he left my house he called, saying "I just tried to listen to this in my wife's car, and she has a REAL good CD player, and it won't play".

To which I say....."It's a DATA CD"

"Oh....it's a data CD?"

"Yes, whould you like an audio CD so you can play it for your wife?"

"Yes, maybe that's a good idea"

So he came right back and I burnt an audio CD for him.

The things you have to put up with sometimes.

Rod

I assume that client just went on the "I give you your files when you give me my money list" for next time. ;>)

The EXACT same thing happened to me last week. The client is so convinced that nothing is on the CD I gave him, that he still hasn't paid. He's waiting until the engineer at his studio confirms that 24-bit .wav files cannot be played on a stereo.

Sometimes I wonder how some people manage to change channels on their TV...

....mind you, strange I should say that, because now that we have digital television over here and digital set to boxes are becoming more common, a lot of people are actually beginning to have trouble with that too. "But, but why can't I just press 9 on the TV remote to watch channel 9?"...

Cheers,
Kim.

I agree. I think this should extend to those who don't have the native

intelligence to sign/punch/or otherwise properly manipulate a ballot as well.

What about those who don't have the civic mindedness to implement a reliable, secure, private, voter-verifiable voting system? Without that it doesn't matter who votes, it only matters who counts the votes.

Cheers,
-Jamie

Nice quote Deej, that takes me back. I think if Ronnie were still around, he would be in strong support of reliable, secure, private, voter-verified voting systems in the U. S. of A.

As would any red blooded freedom loving American, like yourself. We're not there at the moment and it's not a good thing for any voter and taxpayer, be they Libertarian, Democrat, Republican, Green, Independent or other.

The unfortunate thing is that non-secure, non-verifiable systems were proposed and actually adopted in some places to replace the chad fiasco. Out of the frying pan into the fire.

More here: <http://www.blackboxvoting.org>

Cheers,
-Jamie

I'm with you there Jamie. It just seems like there is so much potential for fraud, not only with voting machines and punch cards but also with the additional problem of registration fraud and the inevitable muddying of the waters by the various interest groups who are always bitching about state laws which disallow those convicted of felons to vote. Rather than working to have the laws changed, they seem to want to keep them in place so that they can use them opportunistically at election time in order to paint the *establishment* as unfair and hard hearted. Then after the election is over, the whole issue is forgotten. It's incredibly hippocritical.

What would you suggest as a bulletproof electoral system, keeping in mind that since this is a representative republic with an electoral college, the electors will have the final vote?

Deej,

Are you saying that all those that are elected went to College?
Surely not

Cheers
Martin Harrington

Deej, you can read this long rant. But go here, too:

<http://www.votersunite.org/>

There is no bulletproof election system. I favor voting systems that are run publicly, not privately. I wouldn't outsource elections across the country to a few companies. It just invites corruption.

In Canada they vote with paper ballots. The count is quick and the opportunity for fraud is much less than with invisibly hackable computer-based systems.

An electronic voting machine with a removable memory card that can be easily hacked on site is the wrong way to go. Any system hackable via the internet is the wrong way to go. Any system with proprietary software that cannot be tested for vote altering routines is the wrong way to go. Any system that has a central counting server that can be hacked is the wrong way to go.

Beyond making fraud easier, and difficult or impossible to trace, computer-based systems also suffer software and hardware bugs and failures that could change vote totals accidentally.

Proposals to tie the strengths of each together include touchscreen systems that generate a voter-verifiable paper ballot. IF the paper ballot is what is actually counted, that has potential. Some of these schemes just have the paper as a backup for 1% random recounts in an attempt to catch fraud, but they use the electronic count as THE count. That is iffy. Some count paper ballots with scanners. The scanners can be hacked, so testing with manual counts is important.

Right now there are a few companies wining and dining county clerks and landing huge contracts. These companies count your vote. I've seen the claim that 80% of all votes in America are counted by only two companies: Diebold and ES&S. FWIW the vice president of Diebold and the president of ES&S are reportedly brothers.

You mentioned felons, it's been reported that Diebold has five felons on their development team and a Senior VP who was convicted of 23 counts of felony theft.

Proprietary code runs on the machines. No one is allowed to look at the code. Their technicians have way too much opportunity on-site and in tabulation centers because the county people don't know how to run them. Systems are inadequately tested and then given approval without real tests for security and reliability.

Why is this happening? Follow the money.

Computer-based voting machines are sold as a way to make elections easier for the clerks (clerks eat that up), but democracy isn't about being easy. They are taking advantage of HAVA laws that spend large

amounts of your federal tax money on systems that are supposed to be easier for handicapped voters, while making voting less secure and accurate for all voters. The handicapped voters I have heard speak about this do NOT like being used to promote poor systems. They want secure, accurate, voter-verifiably systems, too. It doesn't have to be one or the other.

Where I live, the county uses touchscreen voting systems with no paper trail. I have no idea if my vote is registering accurately or being counted at all. I testified about this in the state leg. We made some progress in Colorado but much more needs to be done.

Cheers,
-Jamie
<http://www.JamieKrutz.com>

PS. Other kinds of fraud exist, too. There are fights about registration as you point out, and other tricks to slant the turnout. It just goes to show how much the temptation to cheat brings out cheating. No amount of fraud in one area justifies making the system worse in another. We shouldn't have to accept systems that invite invisible electronic fraud, especially knowing how strong the temptation is to cheat.

We're talking about the potential for hidden, major fraud opportunities in all elections on every level. Not just presidential/electoral college situations. It's not good.

Paper ballots would be fine by me. Redundant oversight by election officials representing all parties would be fine too. I wouldn't give a flip if it took a week or two to count the votes. The media would probably hate this because of the *need it now* mindset, but too bad. I think exit polls should be outlawed. the voters need to be responsible enough to show up at the proper polling stations during the hours when the polls are open.....no excuses, no exceptions and no one should be allowed to vote without a voter registration and verifiable picture ID/ proof of citizenship. All voter registration should be completed 60 days so that registrants can be vetted

and validated.during that time. Provisional balloting should be severely restricted or disallowed altogether. If you can't prove who your are and that you have the right to vote and you aren't capable of keeping your affairs in order to properly exercise you voting right within the legal guidelines and timeframe, you're SOL.

Agreed, absolutely. And it's entirely possible to count paper ballots in
a few hours.

> be outlawed.

That's a tough one. First amendment issue.

> timeframe, you're SOL.

I agree somewhat, except if shenanigans are being pulled to disenfranchise voters by underserving certain areas (long lines discourage voting), or if ID systems amount to a poll tax, which is illegal. ID is important, though. Also, 60 days is probably much longer than necessary.

We can agree or disagree here and there, but the gigantic issue towering over the rest is that the voting system is fast becoming untraceably corruptible on a very wide scale. That must **MUST** be fixed, and soon.

Unfortunately the chairman of the committee who needs to approve changes is blocking any attempt to fix HAVA, (he's from Ohio, home of Diebold). Counties are itching to spend HAVA money now if they haven't already, most interpret the law as mandating immediate spending which leaves them choosing insecure systems. It's not only a huge waste of tax money but a direct threat to your vote.

Cheers,

-Jamie

Bruce Schneir has written about this extensively. Both electronic and non-electronic voting systems can be used fradulently, and both have been.

[http://www.schneier.com/blog/archives/2004/11/the_problem_wi t.html](http://www.schneier.com/blog/archives/2004/11/the_problem_wi_t.html)

Non-electronic voting systems are usually used fraudulently in ham fisted ways like taking sacks of Joe Kennedy's cash to West Virginia to buy it for his boy. Electronic ones are used differently when fraud is the goal. Any rational US citizen should want accurate vote tallying and good electronic systems (as Schneir points out) can make that result more likely. Bad systems almost assure bad tallies.

BTW - Democrat bellyaching about voter fraud rings rather hollow to one with a solid understanding of US electoral history. Capitol D Democratic political machines all over the East Coast and in Chicago and Ohio regularly brokered presidential elections with deeply questionable tactics. The current Republican administrations are using similar tactics to those they suffered for years as the minority party. Payback's a bitch.

I voted for Nader last time, in case anyone is wondering, because he actually does want an accurate as opposed to winning vote count.

You hit the nail on the head again DJ. To quote the incredibly profound movie Spiderman ;>), "With great power comes great responsibility." Yeh, I know it's corny, but it's true. As soon as you start talking about people being responsible though, someone starts whining about being disenfranchised. It takes too much time and effort and basic intelligence to be responsible yada, yada, yada. Ok, rant over.

The dead still vote in New Haven. A lot of them. We're one of the last Democratic machine towns in the US. The city council is 1 Republican, 17 Democrats, and two independents who caucus with the Dems. It's nuts.

Read the Schneier article. It's long but it's really good and he wrote the blowfish algorithm (and was almost prosecuted for it) so his security/privacy bona fides are unimpeachable.

Does anyone know the term for making a partisan issue out of an issue that
should be of universal concern?

Agreed that it should be of universal concern. However, that's absolutely correct about the historical aspect and the historical aspect is definitely partisan.

speaking of historical aspects... this goes back to your earlier posts:
<http://en.wikipedia.org/wiki/Eugenics>

Do you think that an entity with so little native intelligence that they cannot function on a level sufficient to allow them to cast a ballot for/against something should be allowed a voice in determining the future government of this country? Sorry, but people who have been legally adjudicated non-compos-mentis are not allowed to vote. Unfortunately, there are many around who are non-compos-mentis, but have not been legally so adjudicated. However, by their obvious inability to function on a competent level, they self-adjudicate, so to speak.

My comments have nothing to do with race. I do have reservations about Darwin Award candidates having a hand in determining my future. If that makes me a Eugenicist in your eyes, then so be it.

All I'm saying is that if you can't get it together to get something so simple right the first time, then you don't have the wherewithall to be a part of the decision making process.

Deej

Good point, cron.

What history shows is that if people can cheat, they will. Doesn't matter the political party. There are plenty of examples to establish the problem.

But what's happening now is the creation of pervasive computer-based systems that offer the following irresistible temptation: Cheating that is potentially easy, quick, undetectable and coast to coast.

For every election.

Dead men voting is child's play compared to this.

I don't care what your political leanings are, if you believe in representative government this is a DISASTER.

Here's another web site:
<http://www.votetrustusa.org/>

Cheers,
-Jamie
