(Primarily in the software.) If it does, can I use the 64 bit processor?

Spappy14.6 mpg in the bmw is hurtin me...

I might have to 'upgrade' to one of those 250mpg modified prius' with the
extra batteries Are mixers and effects ever going to get where the inputs are optical
and you just send optical from your guitar processor / effect processor
to the the mixer over fiber? Current technology seems so 80's.

Peace, JMthe only thing that comforts me is that all our refineries are having problems at the same time and are getting a huge tax break to help them out during these record profit times...thank god...our government is there to help.

>>Here's some interesting reading and listening.
>>Well... between the tar sands project and the millions of holes in the ground around this province, Alberta is in that boat. Record profits here for the oil patch. Our regular gas here in Calgary is at \$0.99 Can/Litre which equals \$3.11951 US/US Gallon.

We also produce WAY more Natural Gas than our Country can use so we sell at *least* half to the US. My "locked-in-as-of-two-years-ago" gas rate is \$6.85 Can/GJ. The funny part about that is that my gas "cost" for last

month (middle of summer) was \$6.64, but they charged me \$15.98 in assorted fees (Fixed charge, Variable charge, Production Rider, Storage Rider and Franchise fee). These fees go up with the gas bill, so they aren't fixed.

The oil companies have us by the "short and curlies"... and they know it. :-\

David.

in
a very small market and I am starting to carve out a niche for myself. The
engineers in the other studios around here have many more years behind the
board than I do (average of around 30 years of full-time *earning a living
at it* kind of experience so I'm a comparative newbie)

I've learned a few things over the years of turd polishing and doing small
demo projects and I'm starting to actually get some small labels sniffing
around my door so I must be doing something right in spite of myself and the
rather limited and haphazard education and experience I've managed to

accumulate.

I'm really feelin' the need to get my head around the finer points of this craft if I'm going to make a go of this. A huge part of this is soundstaging and needing to spend the time to do much more than just pan a reverb send here and there to create a semblance of realism. To that end I've been doing a bit of research and I'm beginning some more in depth experimentation with this. I just want to make sure that my methodology is somewhat sound and that I'm not tilting at windmills here. I've got a full plate so though I'd like to be able to spend the next 6 months floundering around learning by making mistakes (my normal MO), but I don't seem to have that luxury right now.

I figure that if I've got a group of musicians on a stage 50' wide, then each panning increment in the 100-100 L/R spread equals 0.25' so for every 4 increments, I'm moving the performer to the left or right by 1'. For example, if I wanted to position the band members within a space 30' across, then from the center, to place the guitarist 15' to stage left, I would pan him left to 60.

This would theoretically put him 10' from the closest wall and 35' from the farthest wall.

Now a few questions about early reflections and predelay and soundstaging in general, as follows:

1. If I'm using a stereo reverb, since the performer is stage left at pan position 60, I would pan the reverb return to stage right 60 and set the ER's for the right side to around 35ms and the ER's to the left to around 10ms with the levels about 2/3 to 3/4 (or less) of the strength of the original signal. This would theoretically give me a basic two dimensional (L/R) location of the musician in an ambient space, right?

Also, do you pan the reverb send to mirror the return? I'm just not getting this for some reason. Seems that panning the send does nothing. Maybe I'm just too overwhelmed at the moment to notice.

2. In order to get the front/back positioning of the musician relative to the other band members and the front/back of the room, using predealy would provide some dimensional space.....right? what I'm not clear about is whether the predelay should be set for positioning the performers relative to the fall of the space that is farthest from them or from the wall that is behind them. I know that since they are broadcasting into the room, that the front makes sense, but music travels all directions and it seems it would

make smoe sense to at least take the back wall into consideration.

Also, I'm thinking that using actual short (2-3 ms delays) between the instruments/performers themselves would help to create some sense of relative front-to-back relational spatiality.

I'm working mostly with acoustic musicians, some drums, but very little in the way of special FX like phaser/chorus/synth stuff,.....just trying to create a realistic optimal and dimensionally realistic space for the performance.

How big a soundstage is generally used for commercial studio projects? I know it's all relative, but if there is some sxort of *go-by* here that is an accepted standard, I'd like to know.

Thanks for indulging my ignorance and enlightening me..Also, I've got an MP3 of a mix that I did last night that I'd like to get some of your opinions on. It's a very talented bluegrass band-5 pieces. It's about 2.5 MB and the soundstage I created for it is small.....around 30' wide. I was trying to get an intimate, realistic feeling to this as it was tracked live in my studio wit

h 10 open mics.

I'd be glad to e-mail it to those here who would be willing to critique it.

TIA for the enlightenment.

;o)

Deej

DeejGeezzzz.....some of my calculations were way off in the description of the location of the performer relative to the walls of the room I described, but the principal is the same.

Also when I'm talking about the front-to-back walls, by front, I mean the farthest wall from the front, facing the stage and the players and the back wall would be the wall behind the musicians. Is this the correct terminology to use?

;oP

sure if you're missing the point entirely, or simply much, much smarter than
me. But I'm an artist, not an engineer, so what do I know? Nothing, I
suppose.

To me, that's the thing about being an engineer that would scare the shit

out of me: the idea that I've got to do anything more complicated than push a few faders up, or tweak one band of EQ on a few channels, lordy! I wouldn't know what to do as an engineer if the band I was recording didn't make it sound magical mostly all by themselves. To me, an engineer shouldn't have to worry about much besides mic placement and gain staging.

But I don't engineer for a living, so I should probably shut up.
