I'm reconfiguring a new computer to run with Paris 3.0 and I'm now at the point where I need to load a wrapper so as to use my UAD-1 plug-ins. Last time I was up and running I used some sort of wrapper that seemed to work fine, but I lost everything when my computer melted down. What is the best way to do this...and also, I've read about people using something called "Senderella" or something like that. Does that work as a wrapper? Do I still need my basic wrapper?

Any suggestion for ways to do this is appreciated.

Thanks,

ron

Dimitrios has figured out a way to drastically reduce the latency of UAD-1 plugins by using a certain wrapper.
