
Subject: Syncing reaper or other to paris AND external midi clock

I know there are discussion about syncing paris with other daws but I am curious if any body knows how to have ,lets say, reaper sync to paris with mtc but also have reaper send or receive midi clock to drive the start and stop of the sequencers from another midi clock only sequencer which in turn would start reaper and start paris too becuase they are sync'd to MTC.

To say this a litle different, I want to use a hardware midi sequencer that can send and receive only midi clock and be able to sync it to paris. I know paris only has MTC, but can any daw receive midi clock AND transmit MTC to paris at the same time? I would think that where your transport is at the time in reaper cubase ect., the midi clock received would start where the transport is located which is where MTC will be currently in paris and other daw. I hope I am getting my question across clearly.

As of now I am waiting to get paris working as I am a new user.

Regards,
Chris
