Hi All,

I'm not sure what happened, but I was listening to a mix I'm working on when suddenly Paris started spitting out loud distortion. When I solo a track it sounds OK, but when not soloing I can barely hear the mix behind the loud distortion. I tried opening an earlier version of the same project and I get the same thing. I'm running 2 EDS cards in a Magma chassis with a single MEC. This same system has been working well for quite a while.

Is it an EDS card gone bad???

Thanks for any help you can offer.

ron

Now an update--If I turn off submix 2 the distortion stops.
It's looking like my card B is going bad.

I'm going to try some trouble shooting to see what happens.

Ron

Let's start with the small first - if that was happening to me, the two first things I'd tick off are bad plugins or corrupted submixes.

1) remove all VST plugins, save PPJ under a new name, quit and restart PARIS; check if problem persists

2) audio files can get corrupted (doesn't seem to happen much nowadays, but this thing's old). Force PARIS to rebuild a possibly corrupted rendered submix using Edmund's old method -

- Open audio window, clear all the light colored submix files,
- Create a new folder, set the record path to it,
- Save the project.

80% of the time I've had weirdness it's either a corrupted audio file or a plugin.

PS: you should be able to check that EDS card pretty easily by opening a different project and seeing if it plays back fine.

I only used EDS plugins on that submix. I've removed them all and still have the same problem.

I also removed all the files from the playing field of submix 2. when I played with files removed from I got no distortion--submix 1 sounds fine, and submix 2 is silent (no files). Then I added back to submix 2 one of the files which is working fine in submix one. When I play back I get the distortion again. So the distortion seems to occur when ANY file is being played in submix 2 even with no effects.

If you move everything to Submix 3 and reassign it to the same EDS card Submix 2 was assigned to, does the problem follow it?

Yes, the problem moves to another submix if card be is assigned to that submix.

Looks like EDS card to me. Do they go bad like that?...just start distorting?

Try re-seating the ribbon cables that connect your EDS-1000's together. Perhaps the clock signal isn't making it to the slave card.

Cheers

Kris

That was my last hope as well....and it worked!!

Thanks,

Ron

Great to hear! So what are we guessing it was that loosened the connection - vibration?
Oxidization on the connectors? Whichever way, I'll wiki it for the next person that runs into it.

It didn't look oxidized, I think it just vibrated loose. It's been working several days now so I think it's OK.

Ah well. Annoying, I know; still, could have been worse - at least there was a free fix.
