Hi All,

I hope that everyone is having a wonderful holiday season with those they love.

As for my PARIS efforts, I started working on something new to deal with the PACE issue. Edmund sent me a PACE free version of PARIS about a year ago (or, he asked me to check if it was PACE free - I think it is), but it required a newer version of a file called AbLibWin.dll, and I didn't have the newer version. That newer build of PARIS.exe was the last thing I received from him.

I started digging into the AbLibWin.dll that came with PARIS 3.0 to see how it was different that the version expected with the new PARIS.exe. The newer one had 4 new functions added. I've managed to spoof AbLibWin.dll to stub in the 4 functions that are missing, but I haven't been able to get the PARIS.exe I was sent to load. It looks like the parsing of the PARIS config file was added, and I've been working on re-creating the missing functions. I haven't made it work yet, despite trying a an old copy of Code Warrior running in a virtual machine to see if that would get it to work. I'm going to keep at it.

I'm also very excited to get the ASIO driver out ASAP.

Have a great holidays everyone!

All the best,

Mike
